végétaux

- (Wikipédia)
  un **végétal** est un organisme appartenant à l'une des diverses lignées qui *végètent* : c'est-à-dire qui respirent, se nourrissent, croissent comme les plantes, selon l'étymologie du terme[1].

- Les végétaux n'ont pas de neurones et donc pas de système nerveux structuré.

- **Réserves énergétiques**

- Les précurseurs des réserves sont au départ toujours des glucides, puisqu'ils sont synthétisés dans les parenchymes chlorophylliens.
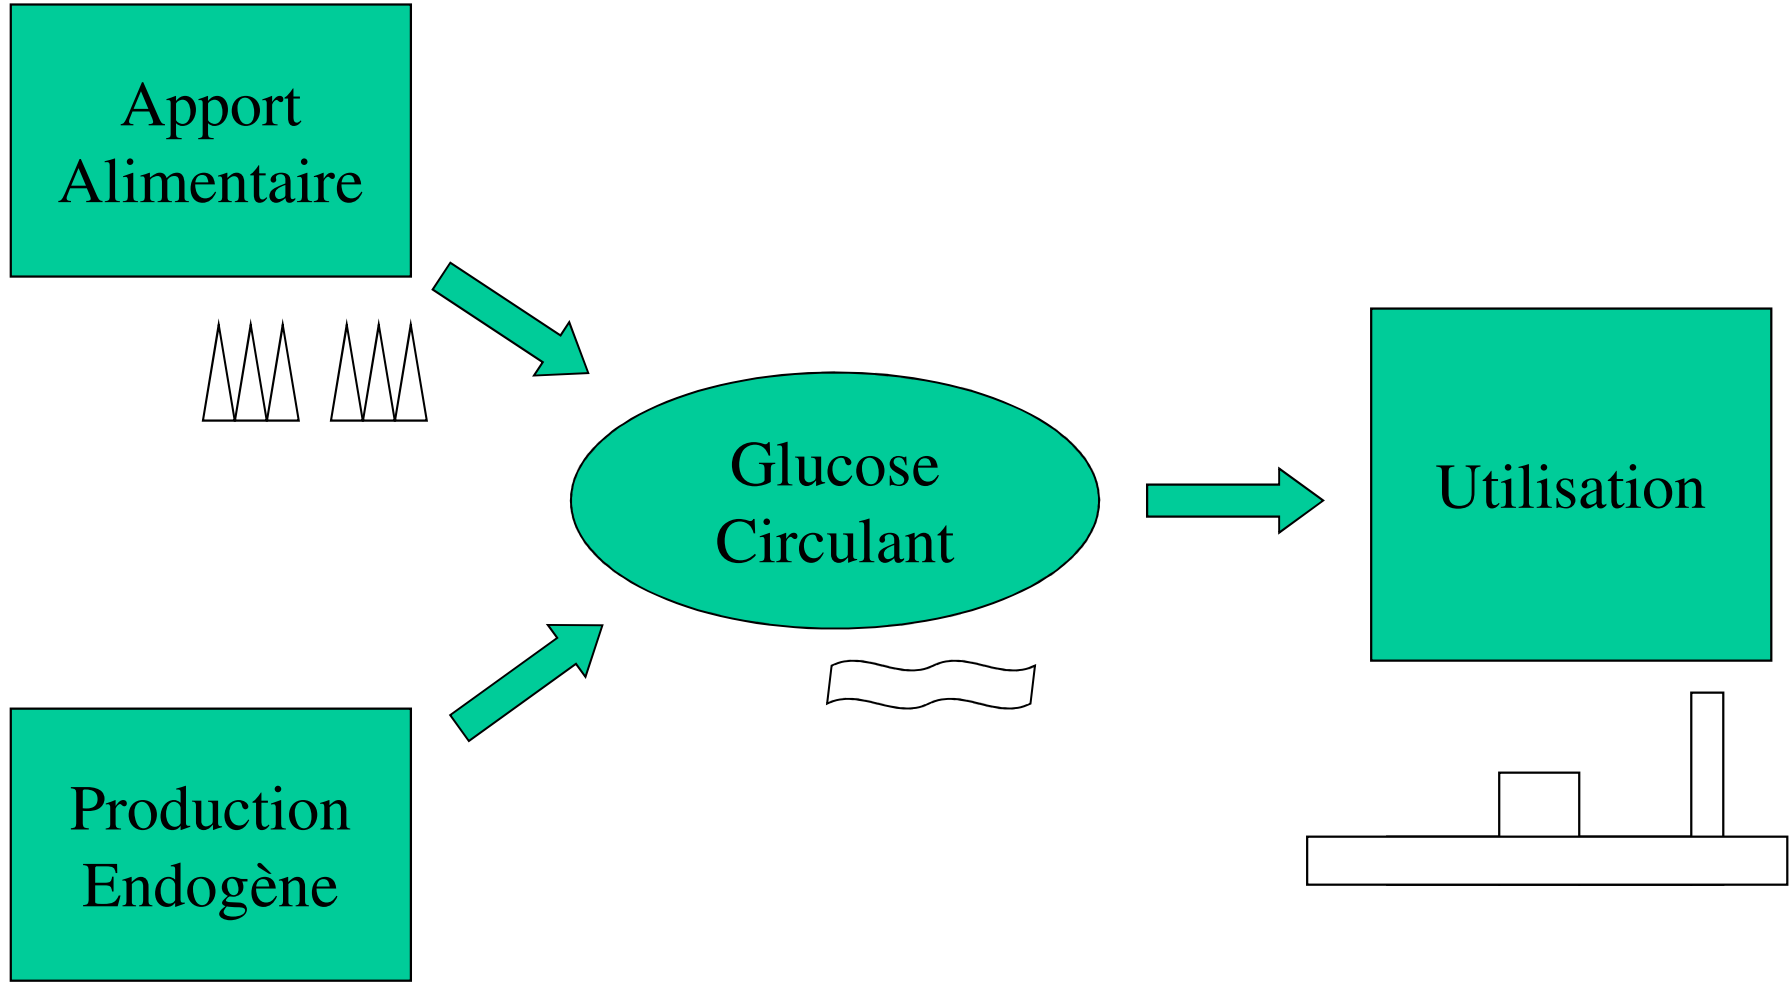

- **Glucides = 4kcal/g**

Animaux

- Par opposition à végétal, être vivant organisé, généralement capable de se déplacer et n'ayant ni chlorophylle ni paroi cellulaire cellulosique.
Tableau I. Réserves énergétiques chez un sujet de 70 kg.

Substrats énergétiques	Tissus	Énergie (Kcal)	Poids (g)
Triglycérides	Tissu adipeux blanc	108 000	12 000
Glycogène	Foie	200	70
	Muscles	400	120
Glucose	Liquides circulants	80	20
Protéines	Muscles	25 000	6 000

Lipides = 9 kcal/g

Base physiopathologique : régulation glycémique

Diabète : définitions

- OMS: « Hyperglycémie chronique avec complications. »

- DT2 (ADA -2017)
  - 90-95% des diabètes
  - « relative insulin deficiency, and peripheral insulin resistance »

Diabète de type 2

Metabolic Factors Contributing to Increased Resting Metabolic Rate and Decreased Insulin-Induced Thermogenesis During the Development of Type 2 Diabetes

Christian Weyer, Clifton Bogardus, and Richard E. Pratley

FIG. 1. SMR in 560 Pima Indian subjects with NGT, IGT, or diabetes (DIA). SMR is adjusted for age, sex, FFM, and FM (least-square mean ± SE). Asterisks indicate significant differences among the three groups (**$P < 0.01$, ***$P < 0.001$).

FIG. 2. Longitudinal changes in RMR (A) ($n = 17$) and IIT (B) ($n = 15$) in Pima Indians, in whom glucose tolerance deteriorated from NGT to IGT to diabetes (DIA) over 5.1 ± 1.4 years (25). RMR and IIT are

that increases in RMR and decreases in IIT occur early in the development of type 2 diabetes, and that both changes are related to the progressive metabolic abnormalities that occur during the development of the disease. *Diabetes* 48:1607–1614, 1999

Monica Vedovato, Antonio Tiengo

Table 2
Published data on the effect of insulin to inhibit proteolysis in T2DM.

Author & date	Experimental design	Isotope used	WB proteolysis
Reduced or no effect [at "basal" or modestly increased (140-200 pmol/L)] insulin concentration (Group A data)			
Staten (1986)	Basal state, following insulin therapy	$^{13}C,^{15}N$-leucine	No change
Umpleby (1990)	Poorly controlled T2DM subjects	^{14}C-leucine	No difference vs. controls
Welle (1990)	Basal state, following insulin therapy	^{13}C-leucine	No change
Biolo (1992)	Basal state, 2× greater insulin than in controls	^{3}H-phenylalanine	No difference vs. controls
Luzi (1993)	Basal state, greater insulin than in controls	^{14}C-leucine	No difference vs. controls
Gougeon (1994)	Isoenergetic diet	^{15}N-glycine/urinary ^{15}N-urea	Greater than in controls
Denne (1995)	Basal state, intensified insulin therapy	$^{2}H_5$–phenylalanine	No change
Gougeon (2000)	Low energy diet	^{15}N-glycine/urinary ^{15}N-urea	No difference vs. controls
Halvatsiotis (2002a)	Basal state, 4× greater insulin than in controls	^{13}C-leucine	No difference vs. controls
Halvatsiotis (2002b)	Basal state & intensified insulin therapy (vs. controls)	^{15}N-phenylalanine, $^{2}H_4$–tyrosine	No difference vs. controls
Barazzoni (2003)	Basal state, modestly greater insulin than in controls	$^{2}H_3$-leucine	No difference vs. controls
Tessari (2005)	Basal state, modestly greater insulin than in controls	^{13}C: $^{2}H_3$-methionine, $^{2}H_3$-leucine	No difference vs. controls
Normal effect at "clamp", high physiological (600-1000 pmol/L) insulin concentration (Group B data)			
Luzi (1993)	Euglucemic, hyperaminoacidemic hyperinsulinemia	^{14}C-leucine	Normal suppression
Denne (1995)	Euglucemic, hypoaminoacidemic hyperinsulinemia	$^{2}H_5$–phenylalanine	Normal suppression
Barazzoni (2003)	Euglucemic, isoaminoacidemic hyperinsulinemia	$^{2}H_3$-leucine	Normal suppression
Tessari (2005)	Euglucemic, hypoaminoacidemic hyperinsulinemia	^{13}C: $^{2}H_3$-methionine, $^{2}H_3$-leucine	Normal suppression
Pereira (2008)	Euglucemic, isoaminoacidemic hyperinsulinemia	^{13}C-leucine	Normal suppression

Diabètes type 3

Table 1   Current classification of diabetes mellitus

I   Type 1 Diabetes Mellitus (β-cell destruction, usually leading to absolute insulin deficiency)
     A: Immune mediated
     B: Idiopathic

II   Type 2 Diabetes Mellitus (may range from predominantly insulin resistance with relative insulin deficiency to a predominantly secretory defect with insulin resistance)

III   Other Specific Types Of Diabetes Mellitus
     A: Genetic defects of β-cell function
     B: Genetic defects in insulin action
     C: Diseases of the exocrine pancreas
       1: Pancreatitis
       2: Trauma/pancreatectomy
       3: Neoplasia
       4: Cystic fibrosis
       5: Hemochromatosis
       6: Fibrocalculous pancreatopathy
       7: Others
     D: Endocrinopathies
     E: Drug- or chemical-induced
     F: Infections
     G: Uncommon forms of immune-mediated diabetes
     H: Other genetic syndromes sometimes associated with diabetes

IV   Gestational Diabetes Mellitus

Profound weight loss in a type 2 diabetic patient with diabetic neuropathic cachexia: A case report

T. Al-Hajeri *, S. El-Gebely , N. Abdella
Fig. 1. The patient prior to the illness.

Fig. 2. The patient on admission to hospital.

A 35-year-old morbidly obese man, diagnosed with type 2 diabetes in 2006, lost nearly 100 kg extremely rapidly soon after the diagnosis, with dramatic painful paraesthesia and autonomic neuropathy, and poor diabetes control. Investigations to find a tumour, or an infectious, endocrinological or digestive disease, to explain his clinical features were all negative. However, with insulin and analgesic treatment, the patient's symptoms improved markedly within a few months; the patient gained 50 kg, while insulin was tapered and then withdrawn, to be replaced by metformin, which maintained perfect diabetes control. Also, the analgesic therapies could be discontinued. This case report is typical of diabetic neuropathic cachexia, first described by Ellenberg in 1974.

Muscle Strength in Type 2 Diabetes

Henning Andersen,[1] Søren Nielsen,[2] Carl E. Mogensen,[2] and Johannes Jakobsen[1]
